# Familiar and Unfamiliar Navigation – UI Design Report

## Introduction

I developed a mobile application prototype that includes three main screens: Login Page, Chat/Home Page, and Profile Page. The design focuses on combining familiar navigation patterns with a few modern interactive elements to enhance user experience.

The objective of this prototype is to create a simple, user-friendly interface while maintaining a visually attractive design using gradient backgrounds and structured layouts.

## Familiar and Unfamiliar Navigation in UI/UX Design

**Familiar Navigation** refers to commonly used design elements that users already understand from other applications. These reduce the learning curve and improve usability.

**Unfamiliar Navigation** includes unique or less commonly used elements that may require slight user adaptation but can enhance engagement and modern appeal.

## Familiar Navigation Elements in My Design

### 1. Login Page

- Username, Email, and Password input fields.
- Login button placed below the fields (standard layout).
- “Forgot Password” link for account recovery.
- “Sign Up Now” link for new users.

These elements are commonly used in most mobile applications, making the login process intuitive and easy to understand.

### 2. Home (Chat) Page

- Search bar at the top for finding users.
- Profile icons displayed horizontally (story-style layout).
- Chat list arranged vertically with profile picture and last message.
- Bottom navigation bar with icons (Home, Search, Add, Chat, Profile).

These are familiar patterns seen in messaging apps, making navigation simple and predictable.

### 3. Profile Page

- Profile picture displayed at top center.
- User details (Name, User ID, DOB, Gender, Status, Work, Mobile, Bio).
- Clear structured information layout.

- Bottom navigation icons for quick switching between pages.

This structured card-style layout ensures clarity and readability.

## Unfamiliar / Modern Navigation Elements in My Design

**1. Gradient Background Design**

- Login and Profile screens use purple-blue gradient backgrounds.
- This enhances visual appeal but is slightly different from plain minimal layouts.

**2. Icon-Based Bottom Navigation**

- Navigation is done using icons instead of text labels.
- Requires users to recognize icons visually.

**3. Minimal Header Icons**

- Hamburger menu icon (☰) for additional options.
- Settings gear icon for profile configuration.
- These provide hidden navigation options.

**4. Visual Profile Card Styling**

- User information is displayed inside a bordered card layout.
- Creates a structured, highlighted information section.

## Design Principles Applied

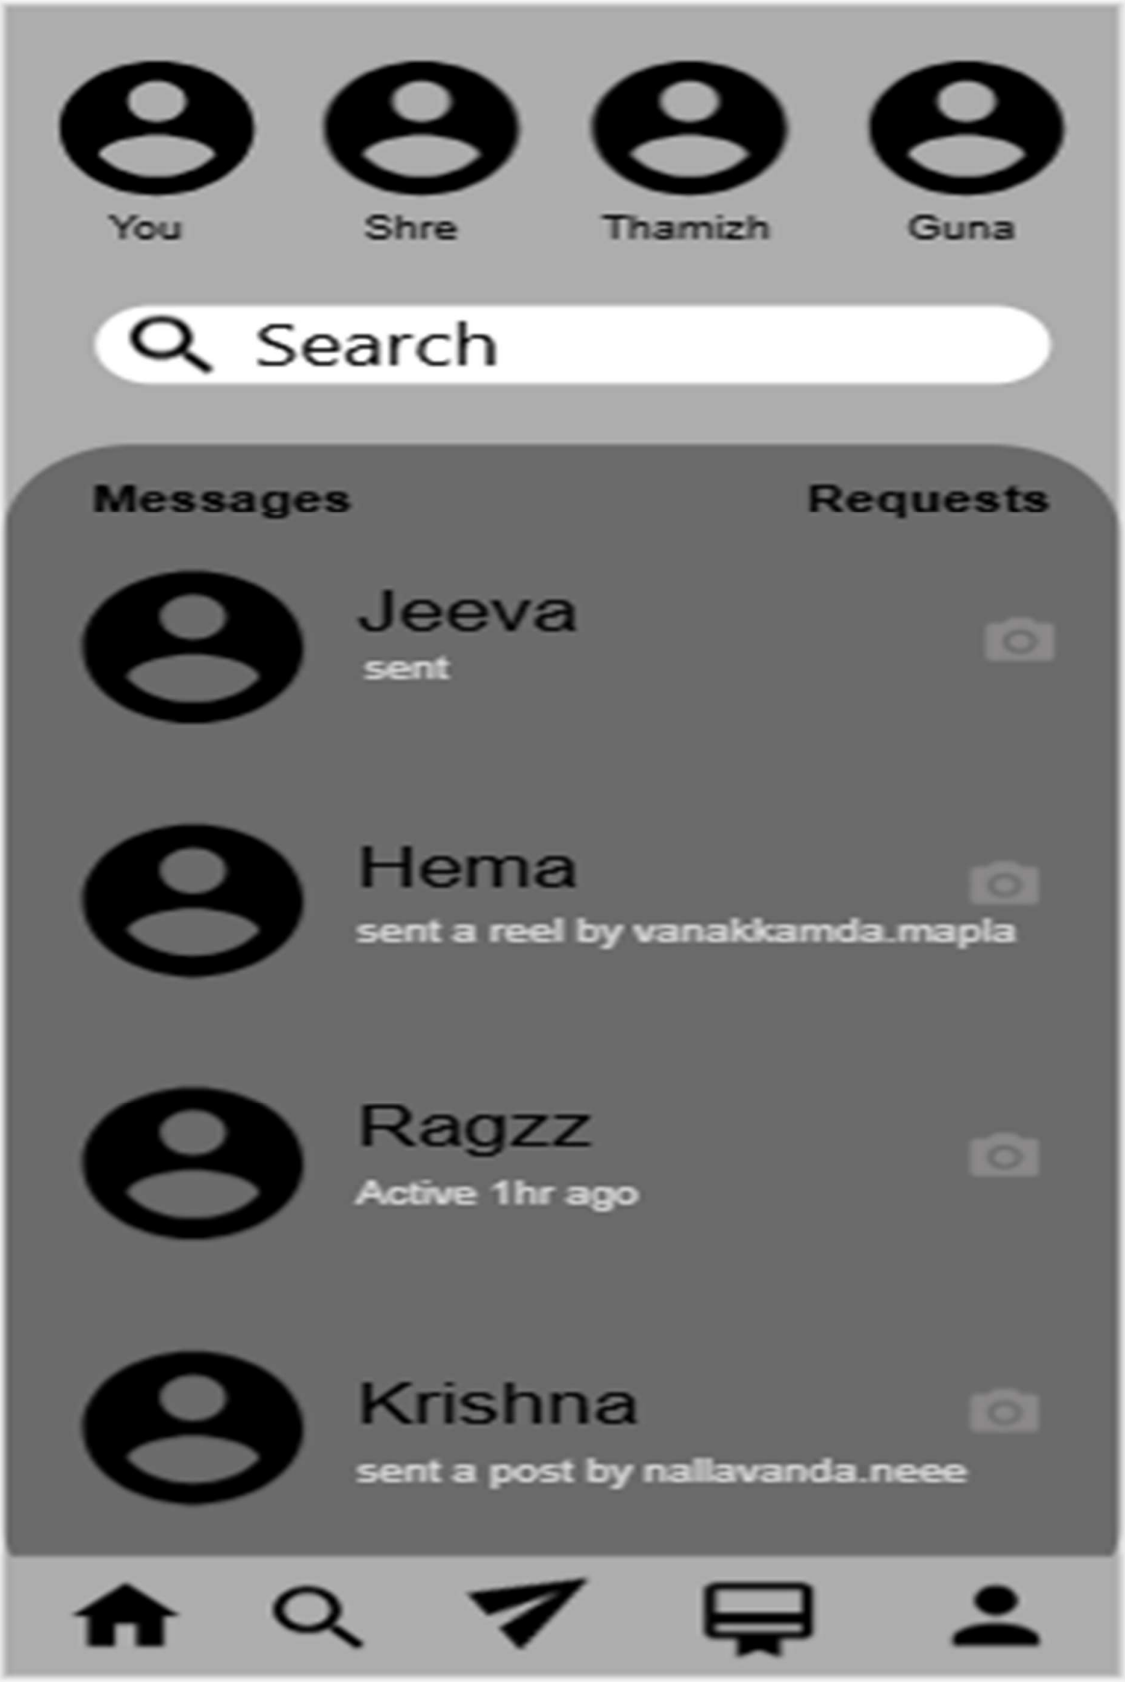
- **Consistency** – Same color theme and icon style across screens.
- **Visual Hierarchy** – Important elements (Login button, Username, Name) are larger and bold.
- **Contrast** – Dark text on light gradient background improves readability.
- **Alignment** – Proper spacing and structured layout for better clarity.
- **User Control** – Easy switching between screens using bottom navigation.

## Prototyping Flow

- Login Page → Home (Chat) Page → Profile Page
- The navigation flow is simple and linear.
  Interactive buttons and icons ensure smooth transitions between screens.
- The design maintains usability while introducing small modern elements to improve overall user experience.

Screen 1: Login Page 430×932

Screen 2: State 1 430×932



Screen 3: State 1 430×932
